

DecisionMesh

Who Uses It & Why

Understanding the users, roles and real-world jobs DecisionMesh is hired to do

decisionmesh.io · April 2026

Overview

DecisionMesh is the AI control plane for enterprise fintech decisions. It sits between your application and your AI vendors — governing every intent, enforcing policies, tracking costs, and building an immutable audit trail. This document describes the six primary user types who interact with DecisionMesh, what they need, and how the platform serves them.

6	distinct user roles	264	fintech intent templates	14	financial domains	4
---	---------------------	-----	--------------------------	----	-------------------	---

prio

User 01

Priya Menon

Compliance Officer · Mid-sized NBFC, Mumbai

The problem they face

RBI audit is in 6 weeks. She needs to show that every AI-driven loan decision was explainable, documented, and policy-compliant. Currently she has no audit trail — just model outputs in a spreadsheet.

What they need from DecisionMesh

- Immutable audit log for every AI decision
- Policy enforcement before any decision executes
- CSV export for regulatory submission
- GDPR-ready data residency controls

How they use the product

Audit Log page

Reviews every intent execution with timestamp, model used, verdict, and drift score

Policy Builder

Sets rules: e.g. no loan approval above Rs 10L without human review

Compliance Reports

Exports 90-day decision history for RBI submission

"I don't care which AI model you use. I care that I can prove what it decided and why."

Plan

Pro (SSO + SAML, 5 team seats)

Common intents

kyc_verification, screen_sanctions, validate_document, check_pep, audit_trail

User 02

Arjun Sharma

ML Engineer · Payments Fintech, Bengaluru

The problem they face

His team uses 3 different fraud models — one from OpenAI, one in-house, one from a vendor. Each has different latency and accuracy profiles. There's no single control point, no budget enforcement, and no way to A/B test them systematically.

What they need from DecisionMesh

- Single API for all AI vendors — no more per-vendor SDKs
- Economy / Standard / Premium tier routing by cost
- Automatic retry and drift detection in production
- Credit budget enforcement per tenant

How they use the product

Playground

Tests new fraud detection intents before deploying to production

Execution Monitor

Watches live intent executions — latency, cost, adapter used

Intent API

Submits intents programmatically via POST /api/intents with idempotency key

"I want one API to rule them all. I'll set the budget ceiling and you pick the best model."

Plan

Builder (API access, all adapters, drift detection)

Common intents

detect_fraud_transaction, authorize_card, verify_upi, score_transaction_risk

User 03

Lakshmi Nair

VP of Credit · Digital Lending Platform

The problem they face

Her credit models were trained on 2022 data. Market conditions shifted in late 2024. The models are drifting — approving loans they shouldn't and rejecting good ones — but she has no systematic way to detect this before it costs the business.

What they need from DecisionMesh

- Real-time drift scoring on every credit decision
- Human-in-the-loop gates for high-risk loans
- Model version tracking as models get updated
- Satisfaction scoring to measure outcome quality

How they use the product

Drift Dashboard

Monitors drift score trends across `approve_loan` and `predict_default` intents

Intent Detail

Drills into a specific decision to see which model ran, what score it gave, and the full objective payload

Human-in-loop Gates

Flags any loan above Rs 25L for manual review before approval executes

"I need to know when my model stops working before the NPAs tell me."

Plan

Pro (human-in-the-loop, multi-tenancy)

Common intents

`approve_loan`, `predict_default`, `calculate_credit_score`, `assess_borrower_risk`, `monitor_loan_risk`

User 04

Rajan Pillai

CTO · Series B Fintech, Hyderabad

The problem they face

His engineering team has built direct integrations with OpenAI, Claude, and a local LLM. If any vendor raises prices or has an outage, the whole system breaks. The board is asking about AI governance and he has no answer.

What they need from DecisionMesh

- Vendor-agnostic AI layer — swap models without code changes
- Cost analytics: which AI vendor is cheapest per intent type?
- Governance story for the board and investors
- SOC-2 readiness via immutable audit logs

How they use the product

Cost Analytics

Compares cost per intent type across OpenAI, Claude, Gemini — makes data-driven vendor decisions

Adapters page

Adds/removes AI vendor adapters without touching application code

Org Branding + SSO

Sets up SAML for the 30-person engineering team

“We’re paying OpenAI like they have no competition. That needs to change.”

Plan

Enterprise (unlimited, BYOK, dedicated SLA)

Common intents

All 264 — routes by cost and performance per domain

User 05

Divya Krishnan

Finance Operations Manager · Large Bank

The problem they face

Her AP/AR team manually processes 400+ invoices per day. They use an AI tool for extraction, another for matching, another for anomaly detection. None of them talk to each other, none have audit trails, and the finance controller keeps asking her to justify the AI spend.

What they need from DecisionMesh

- Single governed pipeline: extract -> validate -> match -> approve invoice
- Anomaly detection with explainable verdicts
- Credit pack top-ups for seasonal volume spikes
- Full reconciliation audit trail

How they use the product

Fintech Intent Library

Configures `extract_invoice`, `validate_invoice`, `match_invoice_po`, `detect_duplicate_invoice` as a sequential pipeline

Billing page

Manages monthly credits and buys credit packs during quarter-end volume spikes

Audit Log

Shows the finance controller exactly which invoices were auto-approved vs flagged

“Quarter-end we process 3x the normal volume. I need to top up credits, not renegotiate a contract.”

Plan

Builder + credit packs (Growth or Scale)

Common intents

`extract_invoice`, `validate_invoice`, `match_invoice_po`, `detect_duplicate_invoice`, `flag_invoice_anomaly`, `reconcile_receivable`

User 06

Kiran Reddy

Product Manager · InsurTech Startup

The problem they face

He's building an AI-first insurance underwriting product. The engineering team keeps asking which AI vendor to use. He wants to ship fast without locking into a vendor, and he needs to show insurers that every underwriting decision is auditable and policy-bound.

What they need from DecisionMesh

- Ship underwriting AI without vendor lock-in
- Playground to prototype intent flows before engineering builds them
- Policy constraints baked into every decision (not bolted on later)
- Intent library as a starting point — not building from scratch

How they use the product

Playground + Intent Library

Selects `assess_insurance_risk`, `calculate_premium`, `underwrite_policy` from the library and tests JSON payloads in the UI

Policy Builder

Sets constraints: max latency 500ms, no Premium tier on policies under Rs 10,000

IntentsTable

Tracks all underwriting decisions across phases to debug failures before they reach customers

"I can prototype a new underwriting flow in the Playground in 20 minutes. That used to take a sprint."

Plan

Hobby to start, upgrade to Builder at launch

Common intents

`assess_insurance_risk`, `calculate_premium`,
`underwrite_policy`, `validate_claim`, `detect_claim_fraud`

All Roles at a Glance

Every person who interacts with DecisionMesh has a different primary job. The table below maps each role to the features they use most and the outcome they are trying to achieve.

Role	Primary features	Job to be done
ML / AI Engineers	API, Playground, Execution Monitor, Adapters	Submit intents programmatically, monitor execution, tune models
Product Managers	Intent Library, Playground, IntentsTable	Prototype flows, browse 264 fintech intents, track decision phases
Compliance Officers	Audit Log, Policy Builder, Reports	Enforce policies, export audit trails, meet regulatory requirements
Finance / Ops Teams	Intent Library (AP/AR, Billing), Credit Packs	Automate invoice and reconciliation pipelines, manage seasonal volume
CTOs / Architects	Cost Analytics, Adapters, Org Branding, SSO	Vendor strategy, cost optimisation, governance story for the board
Credit / Risk	Drift Dashboard, Intent Detail, Human-in-loop Gates	Detect model drift before it causes losses, add human review checkpoints
Founders	All of the above + Billing, API Keys	Ship governed AI products without building the control plane from scratch

A Series B+ Indian fintech (payments, lending, or NBFC) that already has a compliance team asking "how do we audit AI decisions?", and is facing a real risk. DecisionMesh's Razorpay integration, INR pricing, and this the natural beachhead.
